

DCS SRS VoiceAttack by Bailey

Install like a normal .vap (VoiceAttack profile). This profile is pretty straightforward. Use it to interact with DCS and SRS to change your radios and transponder settings.

Change the sound in the command "Complete Sound Effect" if you want a different confirmation sound effect. There are a lot of commands under the hood, so please be patient when applying changes to the profile. Take a look at 'Bailey SRS for DCS v2.0 Commands.html', included in the download. You can print it out if you like too. Or you can make one yourself. Check out the Voice Attack Readme for how to Export commands. You can also check out the VA Readme on how to use this profile as a Global Profile. It will enable you to use this VoiceAttack while you use other profiles.

SRS Frequencies

This profile will accept frequencies as low as 1.000Mhz, up to 399.975 Mhz.

You MUST remember some important things when saying frequencies:

1. Say "point". Example: "radio 1 frequency one two three **point** five two five"
2. This VA profile simulates actual frequencies. Basically, frequencies are adjusted in 0.025 hops. For example: 123.000, then 123.025, then 123.050, then 123.075, then 123.100, then 123.125, etc. Just say the freq you want and you should be fine. Don't make freqs up. You don't have to say trailing zeros.
3. Mode 1 is 2 digits, 0-7.
4. Mode 3 is 4 digits, 0-7.
5. Use the commands when the chat box is un-selected (eg, you are not already typing something).

Enjoy! If you have any questions, concerns, suggestions, or just want to say thanks, feel free to contact me on Discord: Bailey#6230 Thank you to LazyBoot of the Hoggit Discord for the idea. Thank you to Ciribob for SRS and SRS sounds!
